

Classroom Assessment: Minute by Minute, Day by Day

(to appear in *Educational Leadership*, November 2005, 63(3) Please check against published version)

Siobhan Leahy, Christine Lyon, Marnie Thompson, and Dylan Wiliam

In classrooms that use assessment to support learning, teachers continually adapt instruction to meet student needs.

There is intuitive appeal in using assessment to support instruction: assessment *for* learning rather than assessment *of* learning. We have to test our students for many reasons, and, obviously, such testing should be useful in guiding teaching. Many schools formally test students at the end of a marking period--that is, every six to 10 weeks--but the information from such tests is hard to use, for two reasons. First, only a small amount of testing time can be allotted to each standard or skill covered in the marking period. Consequently, the test is better for monitoring overall levels of achievement than for diagnosing particular weaknesses. Second, the information arrives too late to be useful. We can use the results to make broad adjustments to curriculum, such as spending more time on a unit, reteaching it, or identifying teachers who appear to be particularly successful at teaching particular units. But if we are serious about using assessment to improve instruction, then we need more fine-grained assessments, and we need to use the information to modify instruction in real time.

What we need is a shift from *quality control* in learning to *quality assurance*. Traditional approaches to instruction and assessment involve teaching some given material, and then, at the end of teaching, working out who has and hasn't learned it--akin to a quality control approach in manufacturing. In contrast, assessment *for* learning involves adjusting teaching while the learning is still taking place--a quality assurance approach. Quality assurance also involves a shift of attention from teaching to learning. The emphasis is on what the students are getting out of the process rather

than on what teachers are putting into it, reminiscent of the old joke that schools are places where children go to watch teachers work.

In a classroom that uses assessment to support learning, the divide between instruction and assessment blurs. Everything students do--such as conversing in groups, completing seatwork, answering and asking questions, working on projects, handing in homework assignments, even sitting silently and looking confused--is a potential source of information about what they do and do not understand. The teacher who consciously uses assessment to support learning takes in this information, analyzes it, and makes instructional decisions that address the understandings and misunderstandings that these assessments reveal. The amount of information can be overwhelming--one teacher likened it to "negotiating a swiftly flowing river"--so a key part of using assessment for learning is figuring out how to hone in on a manageable range of alternatives.

Research supports that attention to assessment for learning improves student achievement. About seven years ago, Paul Black and one of the authors, Dylan Wiliam, found that students taught by teachers who used assessment for learning would achieve in six or seven months what would otherwise take a year (Black & Wiliam, 1998). More important, these improvements appeared to be consistent across countries (including Canada, England, Israel, Portugal, and the United States), as well as across age brackets and content areas. We also found, after working with teachers in England, that these gains in achievement could be

sustained over extended periods of time. They even held up when we measured student achievement with externally mandated standardized tests (see Wiliam, Lee, Harrison, & Black, 2004).

With this research and these ideas as a starting point, we and other colleagues at Educational Testing Service (ETS) have been working for the past two years with elementary, middle, and high school teachers in Arizona, Delaware, Maryland, Massachusetts, New Jersey, New Mexico, and Pennsylvania. We have deepened our understanding of how assessment for learning can work in U.S. classrooms, and we have learned from teachers about the challenges of integrating assessment with instruction in their classrooms.

Our Work with Teachers

In 2003 and 2004, we explored a number of ways of introducing teachers to the key ideas of assessment *for* learning. In one model, we held a three-day workshop during the summer, in which we introduced teachers to the main ideas of assessment for learning and the research that shows that it works. We then shared specific techniques that teachers could use in their classrooms to bring assessment to life. During the subsequent school year, we met monthly with these teachers, both to learn from them what really worked in their classrooms and to offer suggestions about the ways in which they might develop their practice. We also observed their classroom practices to gauge the extent to which they were implementing assessment for learning techniques and the effects these techniques were having on student learning. In other models, we spaced out the three days of the summer institute over several months (for example, one day in March, one in April, and one in May) so that teachers could try out some of the techniques in their classes between meetings.

As we expected, different teachers found different techniques useful. What worked for some did not work for others, and this confirmed for us that there could be no one-size-fits-all package. However, we did find that a set of five broad strategies is equally relevant for teachers

of all content areas and at all grade levels. The five strategies are

- Clarifying and sharing learning intentions and criteria for success.
- Engineering effective classroom discussions, questions, and learning tasks.
- Providing feedback that moves learners forward.
- Activating students as the owners of their own learning.
- Activating students as instructional resources for one another.

We think of these strategies as somewhat nonnegotiable in that they define the territory of assessment for learning. More important, we know from the research and from our work with teachers that these strategies are always desirable things to do in any classroom. However, the way in which a teacher might implement one of these strategies with a particular class or at a particular time requires careful thought. A self-assessment technique that works for students learning math in the middle grades may not work in a 2nd grade writing lesson. Moreover, what works for 7th grade pre-algebra in one classroom may not work for 7th grade pre-algebra in a classroom down the hall because of differences in the students or in the teacher's teaching style.

Given this variation, it is important to offer teachers a range of techniques for each strategy, making them responsible for deciding which techniques they will use and allowing them time and freedom to customize these techniques to meet the needs of their students.

Teachers have tried out, adapted, and invented dozens of techniques, reporting on the results in meetings and interviews (to date, we have cataloged more than 50 techniques, and we expect the list to expand to more than 100 in the coming year). Many of these techniques require only small but subtle changes in practice, yet research on the underlying strategies suggests that they have a high "gearing," meaning that small changes in these practices can leverage large gains in student learning (see Black &

Wiliam, 1998; Wiliam, 2005). Further, the teaching practices that support these strategies are low-tech, low cost, and usually within the capabilities of individual teachers to implement. In this way, they differ dramatically from large-scale interventions, such as class-size reduction or curriculum overhauls. We offer here a brief sampling of techniques for implementing each of the five assessment-for-learning strategies.

Clarify and Share Intentions and Criteria

Low achievement is often the result of students failing to understand what teachers require of them (Black & Wiliam, 1998). Many teachers address this issue by posting the state standard or learning objective at the start of the lesson, but such an approach is rarely successful because the standards are not written in student-friendly language.

Teachers in our various projects have explored many ways of making both their criteria for success and learning intentions more transparent to students. One common method involves circulating work samples, such as lab reports, that a previous year's class completed, in view of prompting a discussion about quality. Students decide which reports are good, what's good about the good ones, and what's lacking in the weaker ones. Teachers have also found that by choosing the samples carefully, they can tune the task to the capabilities of the class. Initially, a teacher might choose four or five samples at very different quality levels to get students to focus on broad criteria for quality. As students grow more skilled, however, teachers challenge them with a number of samples of similar quality to force the students to become more critical and reflective.

Engineer Effective Classroom Discussion

Many teachers spend a considerable proportion of their instructional time in whole-class discussion or question-and-answer sessions, but these sessions tend to rehearse existing knowledge rather than create new knowledge for students. Moreover, teachers generally listen for the "correct" answer instead

of listening for what they can learn about the students' thinking; they listen *evaluatively* rather than *interpretively* (Davis, 1997). The teachers with whom we have worked have tried to address this issue by asking students questions that either cause students to think or provide teachers with information that they can use to adjust instruction to meet learning needs.

As a result of this focus, teachers have become aware of the need to carefully plan the questions that they use in class. Many of our teachers now spend more time planning instruction than grading student work, a practice that emphasizes the shift from quality control to quality assurance. By thinking more carefully about the questions they ask in class, they can check on students' understanding while the students are still in the class, rather than after they have left, as is the case with grading. Some questions are designed as "range-finding" questions to reveal what students know at the beginning of an instructional sequence. For example, a high school biology teacher might ask the class what proportion of the water taken up by the roots of a corn plant is lost through transpiration. Many students believe that transpiration is "bad" and that plants try to minimize the amount of water lost in this process, whereas in fact, water plays an important role in the transportation of nutrients around the plant. A middle school mathematics teacher might ask students to indicate how many fractions they can find between $\frac{1}{6}$ and $\frac{1}{7}$. Some students will think there aren't any; others may suggest an answer that, although in some way understandable, is an incorrect use of mathematical notation, such as $1 \text{ over } 6 \frac{1}{2}$. The important feature of such range-finding items is that they can help a teacher judge where to begin instruction.

Of course, teachers can use the same item in a number of ways, depending on the context. They could use the question about fractions at the end of a sequence of instruction on equivalent fractions to see whether students had grasped the main idea. A middle school science teacher might ask students at the end of a laboratory experiment, "What was the dependent variable in today's lab?" or a social studies teacher, at the end of a project on World War II,

might ask students for their views about which year the war began and for reasons supporting their choice.

Teachers can also use questions to check on student understanding before continuing the lesson. We call this a “hinge point” in the lesson because the lesson can go in different directions, depending on student responses. By explicitly designing these hinge points into instruction, teachers can make their teaching more responsive to their students’ needs in real time.

However, no matter how good the hinge-point question, the traditional model of classroom questioning presents two additional problems. The first is lack of engagement. If the classroom rule dictates that students raise their hands to answer questions, then students can disengage from the classroom by keeping their hands down. For this reason, many of our teachers have used the idea of “no hands up, except to ask a question.” The teacher can either decide who to call on to answer a question or use some randomizing device, such as name cards or a beaker of Popsicle sticks with the students’ names written on them. This way, all students know that they need to stay engaged because the teacher could call on any one of them. One teacher we worked with reported that her students love the fairness of this approach and that her shy students are showing greater confidence as a result of being invited to participate in this way. Other teachers have said that some of their students think it’s not fair because they don’t get a chance to show off when they know the answer.

The second problem with traditional questioning is that the teacher gets to hear only one student’s thinking. To gauge the understanding of the whole class, the teacher needs to get responses from all the students in real time. One way to do this is to have all students write their answers on individual dry-erase boards, which they hold up at the teacher’s request. The teacher can then scan responses to see novel solutions as well as misconceptions. This technique would be particularly helpful with the fraction question we cited.

Another approach is to give each student a set of four cards, labeled A, B, C, and D, and ask

the question in multiple-choice format. If the question is well designed, the teacher can quickly judge the level of understanding in the class. If all students answer correctly, the teacher can move on. If no one answers correctly, he or she might choose to reteach the concept. If some students answer correctly and some answer incorrectly, the teacher can use that knowledge of who responded correctly and who responded incorrectly to engineer a whole-class discussion on the concept or match up the students for peer-teaching. Hinge-point questions provide a window into students’ thinking and, at the same time, give the teacher some ideas about how to take the students’ learning forward.

Provide Feedback that Moves Learners Forward

After the lesson, of course, comes grading. The problem with giving a student a grade and a supportive comment is that these practices don’t cause further learning. Before they began thinking about assessment for learning, none of the teachers with whom we worked believed that their students spent as long considering teacher feedback as it had taken them to provide that feedback. Indeed, the research shows that when students receive a grade and a comment, they ignore the comment (see Butler, 1988). The first thing they look at is the grade, and the second thing they look at is their neighbor’s grade.

To be effective, feedback needs to cause thinking. Grades don’t do that. Scores don’t do that. And comments like “good job” don’t do that either. What *does* cause thinking is a comment that addresses what the student needs to do to improve, linked to rubrics where appropriate. Of course, it’s difficult to give insightful comments when the assignment asked for 20 calculations or 20 historical dates, but even here, feedback can cause thinking. For example, one approach that many of our teachers have found productive is to say to a student, “Five of these 20 answers are incorrect. Find them and fix them!”

Some of our teachers worried about the extra time needed to provide useful feedback. However, once students engaged in self-assessment and peer-assessment, the teachers

were able to be more selective about which elements of student work they looked at and could focus on giving feedback that peers were unable to provide.

Teachers also worried about the reactions of administrators and parents. Some teachers needed waivers from principals to vary school policy (for example, to give comments rather than grades in interim assessments). Most principals were happy to permit these changes once teachers explained their reasons. Parents were also supportive. Some even said they found comments more useful than grades because the comments provided them with guidance about how to help their children.

Activate Students as Owners of their Learning

Developing assessment for learning in one's classroom involves altering the implicit contract between teacher and students by creating shared responsibility for learning. One simple technique is using green and red "traffic light" cards, which students leave on their desks, with the color facing up indicating their level of understanding. A teacher who uses this technique with her 9th grade Algebra classes told us that one day she moved on too quickly, without scanning the students' cards. A student picked up her own card as well as her neighbors' cards, waved them in the air, and pointed at them wildly, with the red side facing the teacher. She wanted to indicate to the teacher to slow down and explain the problem in a different way. The teacher considered this ample proof that this student was taking ownership of her learning.

Students also take ownership of their learning when they assess their own work, using agreed-upon criteria for success. Teachers can provide students with a rubric written in student-friendly language, or the class can develop the rubric with the teacher's guidance (see Black, Harrison, Lee, Marshall, & Wiliam, 2003 for examples). The teachers we have worked with report that students' self-assessments are generally accurate, and students say that assessing their own work helped them understand the material in a new way.

Activate Students as Instructional Resources for One Another

Getting students started with self-assessment can be challenging. Many teachers provide students with rubrics but find that the students seem unable to use the rubrics to focus and improve their work. For many students, using a rubric to assess their own work is just too difficult. Most teachers know, however, that students from kindergarten to 12th grade are much better at spotting errors in the work of other students than in their own, and so peer-assessment, with subsequent advice on how to improve, can be an important part of effective instruction. Students who get feedback are not the only beneficiaries. Students who give feedback also benefit, sometimes more than the recipients. As they assess the work of a peer, they are forced to engage in understanding the rubric, but in the context of someone else's work, which is less emotionally charged. Also, students often communicate more effectively with one another than the teacher does, and the recipients of the feedback tend to be more engaged when the feedback comes from a peer. When the teacher gives feedback, students often just "sit there and take it" until the ordeal is over.

Using peer and self-assessment techniques frees up teacher time to plan better instruction or work more intensively with small groups of students. It's also a highly effective teaching strategy. One cautionary note is in order, however. In our view, students should not be giving another student a grade that will be reported to parents or administrators. Peer-assessment should be focused on improvement, not on grading.

Use Evidence of Learning to Adapt Instruction

Our final strategy is the one that binds the others together: Assessment information should be used to adapt instruction to meet student needs.

As teachers note student responses to a hinge-point question or the prevalence of red and green cards, the teacher can make on-the-fly decisions to review material or pair up those

who understand the concept with those who don't for some peer tutoring. Using the evidence they have elicited, teachers can make instructional decisions that they otherwise could not have made.

At the end of the lesson, many of the teachers with whom we are working have used "exit passes." Students are given 3 x 5 index cards and have to turn in their responses to a question posed by the teacher before they can leave the classroom. Sometimes this will be a "big idea" question, to check on the students' grasp of the content of the lesson. At other times, it will be a range-finding question, to help the teacher judge where to begin the next day's instruction.

Teachers using assessment *for* learning continually look for ways in which they can generate evidence about student learning, and they use this evidence to adapt their instruction to better meet their students' learning needs. They share the responsibility for learning with the learners--students know that they are responsible for alerting the teacher when they do not understand. Teachers design their instruction to yield evidence about student achievement, by carefully crafting hinge-point questions, for example. These create "moments of contingency," in which the direction of the instruction will depend on student responses. Teachers provide feedback that engages students, make time in class for students to work on improvement, and activate students as instructional resources for one another.

All this sounds like a lot of work, but according to our teachers, it doesn't take any more time than the practices they used to engage in, and these techniques are far more effective. Teachers tell us that they are enjoying their teaching more, which is important, given the difficulty of teacher retention.

Supporting Teacher Change

None of these ideas are new, and a large and growing research base shows that implementing these ideas yields substantial improvement in student learning. So why are these strategies and techniques not practiced more widely? The answer is that knowing about these techniques and strategies is one thing. Figuring out how to

make them work in your own classroom is something else.

That's why we're currently developing a set of tools and workshops to support teachers in developing a deep and practical understanding of assessment for learning, primarily through the vehicle of school-based teacher learning communities. After we introduce teachers to the basic principles of assessment for learning, we encourage them to try out two or three techniques in their own classrooms and meet with other colleagues regularly--ideally every month--to discuss their experiences and see what the other teachers are doing (see Black, Harrison, Lee, Marshall, & Wiliam, 2003, 2004). Teachers are accountable because they know they will have to share their experiences with their colleagues. However, the teacher is also in control of what he or she tries out. Over time, the teacher learning community develops a shared language of description of their practice that enables them to talk to one another about what they are doing. Teachers build individual and collective skill and confidence in assessment for learning. Colleagues help them decide when it is time to move on to the next challenge as well as pointing out potential pitfalls.

In many ways, the teacher learning community approach is similar to the larger assessment for learning approach. Both query where learners are now, where they want to get to, and how we can help them get there.

Classroom Assessment: Minute by Minute, Day by Day

Siobhan Leahy, Christine Lyon, Marnie Thompson, and Dylan William

November 2005, Vol. 63, No. 3, pp. xx-xx

Assessment *for* learning, as opposed to assessment *of* learning, requires educators to make a major shift--from quality control in learning to quality assurance, from assessing at the end of teaching to assessing while learning is still taking place. Five nonnegotiable strategies define the territory of assessment for learning: clarifying and sharing learning intentions and criteria for success; engineering effective classroom discussions, questions, and learning tasks; providing feedback that moves learners forward; activating students as owners of their own learning; and activating students as instructional resources for one another.
